

The Basics of Streambank Stabilization

Peter M. Hanrahan, CPESC

Erosion problems along streams and rivers pose a significant problem. Solutions require understanding of a complex series of variables, including soil types, flow velocities, outside bands and vegetation types. This session will examine commonly used techniques, best management practices, and technology. Connecting these tools to sustainable solutions is a significant challenge. This session will attempt to make those connections with a goal of helping participants gain a better understanding of the available tools for facing some of nature's toughest challenges.
